

Final Exam

**Course Questions :**(4 marks)

Let  $\Omega$  be a sample space and  $P$  a probability on  $\Omega$ .

- a) State the axioms of probability.
- b) Let  $A, B \subset \Omega$ . Show that :  $P(B \cap \bar{A}) = P(B) - P(A \cap B)$

**Exercise n°1 : (08 marks)**

In a soil mechanics study, the settlement rate  $S(t)$  of a clay layer under a foundation was measured over 28 days :

|                                 |       |      |      |      |      |      |      |
|---------------------------------|-------|------|------|------|------|------|------|
| Time $t$ (days)                 | 4     | 8    | 12   | 16   | 20   | 24   | 28   |
| Settlement Rate $S(t)$ (mm/day) | 12.00 | 8.94 | 6.66 | 4.97 | 3.70 | 2.76 | 2.06 |

- a) Draw the scatter plot  $(t, S)$  in an orthogonal frame :  
 Horizontal axis : 1 cm  $\rightarrow$  4 days. Vertical axis : 1 cm  $\rightarrow$  1 mm/day.
- b) Is the relationship between  $S$  and  $t$  linear ? Justify.
- c) Let  $Z = \ln(S)$ . Complete the table (round results to 3 decimal places) :

|                 |       |       |    |    |    |    |    |
|-----------------|-------|-------|----|----|----|----|----|
| Time $t$ (days) | 4     | 8     | 12 | 16 | 20 | 24 | 28 |
| $Z = \ln(S)$    | 2.485 | 2.191 |    |    |    |    |    |

- d) Find the equation of the regression line from  $z$  to  $t$ , using the method of least squares.
- e) Deduce the equation of the settlement rate  $S$  in terms of  $t$  (in the form  $S = Ae^{Bt}$ ).
- f) Estimate the settlement rate  $S$  when  $t = 40$  days.

**Exercise n°2 (5 marks)**

In a structural health monitoring study, let  $X$  be the number of micro-cracks detected in a 1-meter section of a concrete beam. The probability distribution function (PDF) of  $X$  is given by the following table :

|              |     |     |     |     |      |
|--------------|-----|-----|-----|-----|------|
| $x_i$        | 0   | 1   | 2   | 3   | 4    |
| $P(X = x_i)$ | 0.4 | 0.3 | $c$ | 0.1 | 0.05 |

1. Determine the value of the constant  $c$ .
2. Determine the expression of the Cumulative Distribution Function (CDF),  $F(x)$ .
3. Calculate the probability that at least 2 cracks are detected in the section.
4. Calculate the expected number of cracks  $E(X)$  and the variance  $V(X)$ .
5. If the repair cost is given by  $C = 50X + 10$  dollars, calculate  $E(C)$ .

**Exercise n°3 (3 marks)**

A survey of soil samples from a highway project gives the following information :  
 40% of samples have High Clay Content (H), 18% of samples have Low Load-Bearing Capacity (L) and 10% of samples have both High Clay and Low Load-Bearing Capacity.

Express the percentage of samples :

- a) Having high clay content or low load-bearing capacity.
- b) Not having high clay content.
- c) Having neither high clay content nor low load-bearing capacity.
- d) Having low load-bearing capacity but not high clay content

**Good Luck**
