

Solutions to the Directed Works Series n°2
--

Exercise n°1 :

In some countries, car number plates begin with a letter of the alphabet, followed by five digits. Calculate how many number plates are possible if :

- a) The first digit following the letter cannot be 0.
- b) The first letter cannot be O or I and the first digit cannot be 0 or 1.

Solution :

Letter

- a) Letter choice (26 options : A–Z)

First digit choice (9 options : 1–9)

second digit choice (10 options : 0–9)

third digit choice (10 options : 0–9)

fourth digit choice (10 options : 0–9)

fifth digit choice (10 options : 0–9)

according to the product rule

$$\text{Total} = 26 \times 9 \times 10 \times 10 \times 10 \times 10 = 2,340,000$$

- b) Letter choice (24 options : excluding O and I) ↓ First digit choice (8 options : 2–9)

second digit choice (10 options : 0–9)

third digit choice (10 options : 0–9)

fourth digit choice (10 options : 0–9)

fifth digit choice (10 options : 0–9)

according to the product rule

$$\text{Total} = 24 \times 8 \times 10 \times 10 \times 10 \times 10 = 1920000$$

Exercise n°2 :

9 people are seated around a round table.

- 1. How many different ways can they sit ? (only the relative position of the nine people in relation to each other is taken into account). relative to each other)
- 2. Same question, but people A and B want to be near to each other.

Solution :

1. Nine people around a round table, so we have circular permutations :

$$(n-1)! = (9-1)! = 8! = 40320$$

2. A and B must sit next to each other

Treat A and B as a single block.

Then we have

$$\text{Number of circular permutations : } (8 - 1)! = 7! = 5,040 .$$

But inside the block, A and B can switch places (2 ways).

$$\text{Ways} = 7! \times 2 = 5,040 \times 2 = 10,080$$

Exercise n°3 :

Find the number of anagrams of the word MISSISSIPPI. Of these anagrams, how many begin and end with the letter S?

Solution :

The word MISSISSIPPI has 11 letters with repeated counts : $M = 1, S = 4, I = 4, P = 2$.

The number of permutations with repetitions is

$$\bar{P}_{11}(1, 4, 4, 2) = \frac{11!}{1!4!4!2!} = 34650$$

Anagrams that begin and end with S We fix in the first and last positions, leaving 9 interior positions with letters $M = 1, S = 2, I = 4, P = 2$. The number of distinct arrangements of these 9 letters is

$$\bar{P}_9(1, 4, 2, 2) = \frac{9!}{1!4!2!2!} = 3780$$

Exercise n°4 : On this 4×4 grid, you can only move to the right or upwards.

- How many paths are there from point A to point B?
- How many of these paths pass through point $P(1;2)$?

Solution :

- The paths from A to B are words consisting of 4 letters u and letters r. So the number of paths is the number of permutations with repetition.

$$\bar{P}_8(4, 4) = \frac{8!}{4!4!} = 3780$$

- From $A(0,0)$ to $P(1,2)$: 3 moves (1 r, 2 u).

$$\bar{P}_3(1, 2) = \frac{3!}{1!2!} = 3$$

From $P(1,2)$ to $B(4,4)$: 5 moves (3 r, 2 u).

$$\bar{P}_5(2, 3) = \frac{5!}{2!3!} = 10$$

According to the Product rule

$$3 \times 10 = 30 \text{ paths.}$$

Exercise n°5 :

Let $C_r^n = \frac{n!}{r!(n-r)!}$, where $n, r \in \mathbb{N}$ and $r \leq n$.

1) Show that :

a) $C_0^n = C_n^n = 1$, $C_r^n = C_{n-r}^n$ (symmetry formula)

b) $C_1^n = n$.

c) $C_{r+1}^{n+1} = C_r^n + C_{r+1}^n$ (Pascal's triangle).

d) $\sum_{i=0}^n C_i^n = 2^n$

2) Using Newton's Binomial formula $(a+b)^n = \sum_{r=0}^n C_r^n a^{n-r} b^r$ with $1 \leq n$, calculate

$$A = \sum_{r=0}^n C_r^n \quad , \quad B = \sum_{r=0}^n C_r^n (-1)^r.$$

3) What is the coefficient of x^6 in the development of $(x+2)^8$ and $(x^2-5)^7$?

Solution :

For $n, r \in \mathbb{N}$ with $0 \leq r \leq n$, define

$$C_r^n = \frac{n!}{r!(n-r)!} = \binom{n}{r}.$$

1) Show the identities.

(1) *Edge values and symmetry.*

$$C_0^n = \frac{n!}{0!n!} = 1, \quad C_n^n = \frac{n!}{n!0!} = 1,$$

$$C_r^n = \frac{n!}{r!(n-r)!} = \frac{n!}{(n-r)!r!} = C_{n-r}^n.$$

(2) *Single-choice value.*

$$C_1^n = \frac{n!}{1!(n-1)!} = n.$$

(3) *Pascal's identity.*

$$C_{r+1}^{n+1} = C_r^n + C_{r+1}^n.$$

$$\begin{aligned} C_r^n + C_{r+1}^n &= \frac{n!}{r!(n-r)!} + \frac{n!}{(r+1)!(n-r-1)!} \\ &= \frac{n!}{r!(n-r)(n-r-1)!} + \frac{n!}{(r+1)r!(n-r-1)!} \\ &= \frac{n!}{r!(n-r-1)!} \left[\frac{1}{(n-r)} + \frac{1}{(r+1)} \right] \\ &= \frac{n!}{r!(n-r-1)!} \left[\frac{(n-r) + (r+1)}{(n-r)(r+1)} \right] \\ &= \frac{n!}{r!(n-r-1)!} \left[\frac{n+1}{(n-r)(r+1)} \right] \\ &= \frac{(n+1)!}{(r+1)!(n-r)!} \\ &= C_{r+1}^{n+1}. \\ &= \end{aligned}$$

2) Using the binomial theorem.

From $(a+b)^n = \sum_{r=0}^n C_r^n a^{n-r} b^r$, $n > 0$:

$$A = \sum_{r=0}^n C_r^n = \sum_{r=0}^n C_r^n 1^{n-r} \times 1^r = (1+1)^n = 2^n,$$

$$B = \sum_{r=0}^n C_r^n (-1)^r = \sum_{r=0}^n C_r^n 1^{n-r} \times (-1)^r = (1-1)^n = 0, n \geq 1.$$

3) Coefficient of x^6 .

(a) In $(x+2)^8$.

$$(x+2)^8 = \sum_{r=0}^8 C_r^8 x^{8-r} 2^r.$$

We need $8-r=6 \Rightarrow r=2$, hence the coefficient is

$$C_2^8 \cdot 2^2 = 28 \cdot 4 = 112.$$

(b) In $(x^2-5)^7$.

$$(x^2-5)^7 = \sum_{k=0}^7 C_k^7 (x^2)^k (-5)^{7-k}.$$

We need $2k=6 \Rightarrow k=3$, hence the coefficient is

$$C_3^7 \cdot (-5)^4 = 35 \cdot 625 = 21875.$$

“

Exercice n°6 :

An urn contains 12 balls numerated from 1 to 12.

3 balls are drawn simultaneously.

- i) Determine the number of different draws.
- ii) Same question if these three balls are drawn successively.
- iii)* What if, after each draw, the ball is put back into the urn.

Solution :

An urn contains 12 balls numbered from 1 to 12. Three balls are drawn.

i) Simultaneous draw (without order).

We simply choose 3 balls out of 12, so the number of different draws is

$$C_3^{12} = \frac{12 \cdot 11 \cdot 10}{3 \cdot 2 \cdot 1} = 220.$$

ii) Successive draw without replacement (order matters).

Here we are counting permutations of 3 elements out of 12 :

$$A_3^{12} = \frac{12!}{(12-3)!} = 12 \cdot 11 \cdot 10 = 1320.$$

iii) Successive draw with replacement.

After each draw the ball is put back, so each of the 3 draws has 12 possible outcomes. Thus :

$$12^3 = 1728.$$

Exercice n°7 :

Consider the set $E = \{1; 2; 3; 4; 5; 6\}$. Using the 6 digits of this set, each taken only once, how many distinct numbers can be formed in each of the following cases :

- a) Numbers of 6 digits ?
- b) Numbers of 4 digits ?
- c) Numbers with 4 digits starting with 3 ?
- d) Numbers of 4 digits containing the digit 3 ?
- e) Numbers of 4 digits containing the digits 3 and 6 ?

Solution :

Let $E = \{1, 2, 3, 4, 5, 6\}$. Form distinct numbers using these digits, each used at most once.

a) Numbers of 6 digits.

All permutations of the 6 digits :

$$6! = 720.$$

b) Numbers of 4 digits.

Permutations of length 4 from 6 digits :

$$A_4^6 = 6 \cdot 5 \cdot 4 \cdot 3 = 360.$$

c) Numbers of 4 digits starting with 3.

Fix the first digit as 3, then permute 3 digits from the remaining 5 :

$$A_3^5 = 5 \cdot 4 \cdot 3 = 60.$$

d) Numbers of 4 digits containing the digit 3.

Count all 4-digit numbers minus those with no 3 :

$$A_4^6 - A_3^5 = 360 - 60 = 300.$$

e) Numbers of 4 digits containing the digits 3 and 6.

$$4 \times 3 \times A_2^4 = 144,$$
